Wildfires are a natural part of living in the Pacific Northwest. Each “season” is different, varying in the number of fires, their intensity, the climate, and the amount of smoke produced. It’s important to be prepared for whatever conditions the season may bring, including potential health effects and evacuations.

Health impacts from wildfire smoke
Wildfire smoke contains small particles and chemicals, which can cause minor to serious health effects. Minor symptoms may include a burning sensation in your eyes, a sore throat, runny nose, headaches, wheezing, coughing, and shortness of breath. In more serious cases, smoke can aggravate existing lung, heart, and circulatory conditions such as asthma attacks, or chest pain. People can experience the most severe effects from smoke the day after they were exposed.

Although smoke is unhealthy for everyone, some people are more susceptible than others: infants and children, people who are pregnant, older adults, and people with heart or lung diseases, diabetes, or respiratory illnesses (including COVID-19). If you have a medical condition, talk with your healthcare provider about how to decrease your risk from smoke.

How to protect your health around wildfire smoke
- **Stay informed about air quality conditions and wildfire activity with the Washington State Smoke blog.**
- Staying indoors in “clean air” is the best way to stay safe around smoke. Keep the air in your home clean by:
  - Closing your windows and doors
  - Improving filtration: build your own box fan filter or use a portable air cleaner with a particle air (HEPA) filter. If you have a forced air heating/air conditioning system, use filters with the highest designated filter rating that your system can handle. Keep the air on “recirculation” mode.
  - Avoiding contributors to indoor air pollution, such as using candles or incense, smoking, broiling or frying food, and vacuuming (unless the vacuum has a HEPA filter).
- Use masks, when appropriate:
  - Cloth and surgical masks will not filter out smoke particles.
  - Properly fitted, NIOSH-certified N95 respirator masks will filter out the particles, but they are not appropriate for everyone. Use these masks on infants or small children, people with lung disease, heart disease, or other chronic illnesses only on the advice of their healthcare provider.
- Know where to go for relief:
  - If you are unable to keep the air in your home clean, consider going to an indoor place with air conditioning—a friend or relative’s home, public locations, city- or county-provided healthy air centers, etc. Be sure to keep COVID-19 considerations and restrictions in mind for public locations.
- Get symptom relief:
  - Use artificial tear eye drops to help flush the smoke from your eyes.
  - Keep yourself, family, pets, and livestock well hydrated. Store bottled or containers of water for use in emergency situations.
  - Consider reducing physical activity, especially if you are sensitive to smoke, or if you have a lung and/or heart condition, such as asthma.
  - Call the Washington Poison Center (1-800-222-1222) with any questions or concerns with wildfire smoke and your health.
- **Have a plan** if you need to evacuate:
  - Create an emergency kit: at a minimum, include copies of important documents, prescriptions and other needed medications, pet food and water, clothing, cell phone chargers, and enough non-perishable food and water for several days.
  - Print out a map marked with at least two evacuation routes.
  - Have enough fuel in your vehicle to travel into a safe area.
  - Write down the phone number and locations of the 2 nearest healthcare facilities.
